Company overview

Ajila AG delivers software development and integration with a well-grounded understanding of modern and innovative enterprise systems.

Our customers benefit from easy-to-use software with high business effectiveness. We enable our clients to use the full potential of Adobe PDF as a universal data container and implement automated document flows with Adobe LiveCycle products.

Furthermore we enhance all web-based applications with an easy-to-use and attractive looking Adobe Flex user interface.

Company solutions

Ajila Enterprise Solutions provides PDF-based solutions for a wide range of business requirements and adds value to the existing company infrastructure. The following list contains examples of the solutions we can implement with Adobe LiveCycle document services:

- Document-based creation of PDF dossiers and documentation triggered by a Document Management System (DMS)
- Automatic generation of high quality offer and order confirmation PDF documents driven by data from an ERP system (e.g. SAP)
- Highly protected documents with very sensitive content that need to be sent within and beyond the firewall. Centralised security management for every single document with limited personalised access permissions (related to the existing company LDAP directory server)
- Form management with centralised, structured form data storage. Statistical functions and dashboards to analyse form-driven processes
- Form-based dynamic workflows that are perfectly aligned with existing business processes, with the integration of customers, partners, suppliers, employees and third party company enterprise software systems
- Automatic high-volume signing of PDF documents with advanced or qualified digital signatures to guarantee authenticity and document integrity
